TRENDS

The Trend Menu is the screen where data is recorded. Here you can view instant and historical data.

SHOW HISTORY TRENDS

You can view the data between two Dates hourly, daily, monthly and yearly.

TREND REPORT

You can export the this data to excel, pdf, imgage.

TABLE VIEW

With the Table View button, it is ensured that the corresponding values of the pens are displayed in a tabular form as follows, apart from the trend depending on time.

TREND SETTINGS

Trend Settings is the section where operations such as adding new Trends, deleting existing Trends, updating, adding new Pen, deleting existing Penes, updating.

$ \begin{array}{c c c c c c c c c c c c c c c c c c c $		Trend Settings

While Adding a New Pen;

- Name
- Alignment
- UnitThickness
- Type (Solid, Dash, DashDot ie Straight, Striped and Dotted Lines)
- Sub Tolerance
- Top Tolerance
- Trend Type
- Peni Göster
- Tag Name

we enter the values.

ADD PEN

To add a new PEN, press the button with the plus (+) sign so a new PEN is added as in the figure below.

PEN GROUP

This is the page where group settings related to PEN are made when the button marked below is clicked. Here we can see the list of trends and if we want to add more pen in it we can add.

After making all the settings here, when we open the relevant trend on the TREND screen, we see the design related to this group will come out.

If this group is checked, the pens belonging to this group will be marked. There is no need to mark one by one.

ALARMS

Alarms module is an RSD module where existing alarms are listed, new alarms are added, alarms can be marked as seen, and alarms between certain dates can be displayed.

Alarms		Alarms Settings					\$
	Ē						3
Drag	a column head	der here to group by that column					٩
	Explanat	tion	Date Start 🔹	Date Seen	Date End	Alarm Type

USERS

The "Users" module is a list where users with access to the program are listed, groups / users have access to the modules, adding a new group / user, or deleting, updating the existing groups / users, and creating and saving the existing group / user list. It is the module where the transactions are made.

TAGS

Tags are the most important elements that provide communication between furnace and "Eagleye RSD" software.

The "Tags Page" lists the existing tags. On this page, "Add new tags", "Delete tags", "Convert the Tag list to excel file" operations are performed.

		F1_Temp - Genel Timer 1905	10	00
	6	F3_Temp - Genel Timer 1906	10	00
	4	F2 Temp - Genel Timer 1904	10	00
	22	Timer	10	00

To determine the frequency of a "Tagic" control, the selection is made from the "LogDate" section in the table.

MAINTENANCE

The maintenance module is an RSD module that lists the maintenance defined for a certain time, new maintenance is added, existing maintenance is deleted, excel is listed, and when the maintenance time comes, it notifies the user with a notification.

If approval is given, the selected link is deleted.

REFRESH PAGE

It is used to refresh the maintenance page so that the changes can be seen. For this process, the "Refresh" button in the second row of the controls on the upper left is pressed.

CALIBRATION

The calibration module is used to calibrate the settings of the furnace such as pressure and temperature at regular intervals with the help of Eagleye RSD software and sensors. Calibration is the determination of whether the device performs incorrect measurements, if it is faulty, the rate of the error is found. Calibrating the devices at regular intervals increases the accuracy of the measurement work performed.

Calibration

- "IN" value is the value from the calibration device.
- "OUT" value is the calibrated value. •
- "SetLow" is the small value we give from the calibration device. .
- "Set High" is the great value we give from the calibration device. •
- •
- "INMin" and "INMax" values will be displayed automatically. "OUT Min" and "OUT Max" values are the output value range. •

Calibration Process Steps

- 1. A small value is entered from the calibration device.
- 2. After this value comes to the "IN" entry, the value we give to the device is written in the "Set Low" section and the "Set" button next to it is clicked.
- 3. A large value is entered from the calibration device.
- 4. After this value comes to the "IN" input, the value we give to the device is written in the "Set HIGH" section and the "Set" button next to it is clicked.
- 5. The value range that we want to see at the exit is entered in "Out Min" and "Out Max" values and click on the "Calculate" button.
- After clicking the calculate button, "IN Min" and "IN Max" values are formed. The calibration process is ended by clicking the "Settings" button in this section.

CALIBRATION SETTINGS

The Calibration Settings module is where the operations such as adding a new calibration, deleting the existing calibration, updating and exporting the calibration list listed in the Calibration Settings section to Excel.

When adding a new Calibration;

- Name
- Calibration Type (Type1, Type2)
- Time (takes a numerical value)
- Time Type (Hour, Day, Week, Month, Year)
- Color
- Explanation
- Tag_In
- Tag_Out
 Tag In Ma
- Tag_In_Max
 Tag_In_Min
- Tag_In_Min
 Tag_Out_Max
- Tag_Out_Max
 Tag_Out_Min
- Tag_Out_init
 Tag_Offset

New Calibration is added by adjusting the parts.

CALIBRATION DELETION

To delete what we want from the existing calibrations, press the button with the cross (x) sign. When you press the button, "Are you sure?" A warning will appear.

It is the part where the process of creating another from one calibration is done.

CONNECTION

The connections are the part where the necessary settings for connection to the devices are made by using the communication protocols such as "SiemensTCP", "OPC", "ModBus", "Internal" of the RSD software and thus communication between the device and the software is provided.

Communication Protocols

4 types of communication protocols are used in RSD Automation.

SiemensTCP

The Siemens TCP / IP Ethernet driver works in harmony with KEPServerEX and provides data exchange between OPC clients and the Siemens S7-200, S7-300, S7-400, S7-1200 and S7-1500 PLC family using the TCP / IP Ethernet protocol. The driver can communicate directly with the S7 PLC using a standard PC network interface card, without the need for additional software packages or libraries. Custom block reading and writing optimization will automatically increase the speed of many applications when using the CP243, CP343 and CP443 processors.

• <u>OPC</u>

The OPC Client driver and KEPServerEX communication platform provide a fast and reliable connection between OPC servers and HMI, SCADA, Historian, MES, ERP and many OPC client applications. You do not need to learn the fine details of third-party servers. This driver also enables Oracle MES and MOC users to include Kepware OPC operations and all other third-party OPC operations in applications.

ModBus

Modbus Ethernet driver works in harmony with KEPServerEX, allowing data exchange between OPC clients and PLC family compatible with Modbus Ethernet protocol. KEPServerEX automatically optimizes data collection according to client demand. Data integrity is ensured securely thanks to comprehensive error management. Kepware's Modbus Ethernet driver performs master and slave operations simultaneously. Slave mode provides data transfer from other Modbus Ethernet devices to the server. Modbus Ethernet driver offers direct integration with Modicon Concept and ProWORX programming packages. If you are using these packages, you can import the tags in your PLC application directly into KEPServerEX. Thanks to this time-saving feature, all relevant PLC data will be instantly available to your OPC client application.

Internal

Internal communication protocol is a limited type of protocol compared to the internal and other protocols used for testing purposes, without using the external protocols listed above.

It is the part where the necessary settings are made for connection to the devices and thus communication is provided between the device and the software.

Connection Name

It is the part where the name of the device to be connected is entered.

Driver

It is the part where drivers such as "SiemensTCP", "OPC", "ModBus", "Internal" are used for communication between the device and the software.

• IP Address / Opc Name

It is the part where the IP Address or Name of the Device to be Connected is entered.

• Server IP (Opc / Modbus)

This is the section where the IP Address of the Server to be connected is entered.

<u>CPU Type</u>

It is the section where CPU Type of Driver used in communication is entered.

• Rack / Modbus Port No

It is the part where Driver / Modbus Port Number of Driver used in communication is entered.

<u>Slot</u>

It is the part where Driver's Slot value used in communication is entered.

<u>Reading Time</u>

It is the part where the connection control is made in how many milliseconds.

Is it disabled?

It is the part that determines whether the connection with the device in question is active or not.

RECIPES

The recipe is a set of values where the desired values (such as Temperature, Pressure) are set to the desired values and sent to the oven at certain steps, that is, loaded and set and adjusted in this way.

SCRIPT SETTINGS

It is the part where the settings related to the script to be created are made.

Script Settings

- Script Name
- Password (Please note. It will be required in case of script deletion.)
- Time and Time Unit
- Event Tag
- Type (It works according to the specified time or event.)
- consists of sections.

SETTING FOR A NEW script

To set up a new script;

- 1. A name is given to the script. Script password (Please Note!) Is determined.
- 2. If Script Type "Timer" is selected, the script time is determined. The script works by repeating at the specified time. Time units are;
 - Milisecond
 - Seconds
 - Minutes
 - Hour
 - ∘ Day
- 3. If Script Type "Event" is selected, an event is created. Event Tag is the section where the condition of the Tag value set is determined. Atag selected from the tag list below is set to the left of the Event Tag box by clicking the "Set Event" button. One of the symbol values that we want is selected from the middle box for comparison of this set tag value with the value we will write on the right side.

These values;

- ==
- !=
- >
- >= • <
- 0 <=
- shaped.
- 4. Desired scripts are written on the Script Screen. If you want to take action on any tag, the tag is selected from the Tag list below. "Bring the tag" button is used to call the selected Tag in script screen. The "Set Tag" button is used to set the selected tag value.

If you want to run immediately after making the script settings, "Run" button is pressed, if it is desired to be saved, it is saved by clicking the "Save" button.

PAGE DESIGN

This is the section where the pages that are desired to be displayed on the RSD Main Screen are designed.

Control Features, Event and Animation Parts

It is the section on the right side of the Page Design screen. It consists of 3 sections.

Features

It is the section where the properties of the selected control are listed and these properties can be changed.

• Event

Thanks to the script written to the selected control, it is the part where an event is wanted

to happen. Event-specific event name at the top of the event section (eg "Click"

event),

Below it is a tag list where all tags in the database are listed by

data type. Below it are the "Bring Tag" and "Set Tag"

buttons.

Get Tag Button

Get Tag Click the Get Tag button, the SM.GET_TAG (tag) method, which draws the value of a tag we select from the tag list above, assigns the tag value to a variable. And this piece of code is added to the script line.

Set Tag Button

With the Set Tag button, a new value is assigned to the tag related to the SM.SET_TAG (tag, "_VALUE_") method, which assigns (sets) the value we will give to the tag we select from the upper tag list. This piece of code is added to the script line.

Script Language

It is the section where we determine which programming language we will write the script we write in the script field.

Run Button

It is used to run the script written in the script field, that is, to test the code.

Save Button

It is used to save the script written in the script field. When we write a script for a control, it must be saved before moving to another control or leaving the page design module.

Animation

Thanks to the script written to the selected control, the script is run as long as the program is running. At the top of the event section there is a tag list where all tags in the database are listed by data type. Below it are the "Get Tag" and "Set Tag" buttons.

Get Tag Button

The SM.GET_TAG (tag) method, which draws the value of a tag we select from the tag list above, takes the relevant tag value and assigns it to a variable. And this piece of code is added to the script line.

Set Tag Button

With the Set Tag button, a new value is assigned to the tag related to the SM.SET_TAG (tag, "_ VALUE_") method, which assigns (sets) the value we will give to the tag we select from the upper tag list. This piece of code is added to the script line.

Script Language

It is the section where we determine which programming language we will write the script we write in the script field.

Run Button

It is used to run the script written in the script field, that is, to test the code.

Save Button

It is used to save the script written in the script field. When we write a script for a control, it must be saved before moving to another control or leaving the page design module.

Label

- It is a tool in which the desired texts can be written easily within the label design screen.
 - Background color, font color, font, font size, etc., from the Label properties tab. adjustments can be made
- easily. Sample Codes;

 - Text Change: DesignObjects.LabelName.Content = "Text to be Written";
 Background Color Change: DesignObjects.LabelName.Background = Brushes. Desired Color;
 Font Color Change: DesignObjects.LabelName.Freground = Brushes. Desired Color;
 Font Size: DesignObjects.LabelName.FontSize = Desired SizeValue;

 - 5. Visibility: DesignObjects.LabelName.Visibility = Visibility. Desired Status (Visible = Visible Hidden = Invisible)

Page Selector

- Page Selector is a special button designed for easy page transitions within our design screen.
- You can easily go to the desired page when clicked by selecting the desired page from the Design FileNames option on the Properties tab.
- With UserLevveloption on the Properties tab, clickable-non-clickable status can be set for different users in
- page transitions. With the same label, background color, font color, font, font size etc. adjustments can be made easily.

ComboListe

- It is a tool developed to provide a comfortable view and easy selection of a desired list with ComboListe tool.
- With the List Tip option on the Properties tab, you can easily call the lists such as Prescription, Tag,
- Database specified previously.
 You can create your own list by adding ComboBoxEditItem. You can find the coding examples of ComboList in sample scripts in sample 3 on the scripts tab.

Calculator

• In cases where calculations are required on the Design screen, you can use the calculator tool for convenience. Justdrag and drop on the Design screen.

ChechEdit

- Depending on whether it is selected with our CheckEdit tool, transactions can be performed. EditValue False on the Properties tab will be unselected on the first page load. If this tab is set to True, it will be loaded in the selected state.
- With the same label, background color, font color, font, font size etc. adjustments can be made easily.
- You can access the information and codes in the sample 2 in the sample scripts tab on the Script examples tab regarding the

ToggleSwitch

- OurToggleSwitch tool has similar functionality to the CheckEdit tool. They are visually different. It has a visually key-like appearance.
- You can access the information and codes in the sample 2 in the sample scripts tab on the Script examples tab about using ToggleSwitch.

Grid

- Grid system is the process of aligning a page horizontally and vertically into columns in the field of graphics and
- design. Using Grid has many advantages for us. Thanks to Grid, it is ensured that our other vehicles that we use stop in the draft area collectively.
- If we make more than one of the same design, we can create it in a grid and reproduce it with the copy-paste
- operation. Likewise, when we want to change the position of our vehicles on the design screen, instead of changing them one by one, all the vehicles in the grid can be positioned in the same way.
- Note: If we align all vehicles positioned in the grid as Left-Top, we will not encounter positioning problems in the changes.

LinearBar

LinearBar tool is a tool developed to display data graphically. Visuality and easy view can be used at

- desired points. Settings such as StartValue (Minimum value), EndValue (Maximum value),
- MaxIntervalCount (Value frequency),
- ShowFloatinPoint (Whether to show digits after comma), TemperatureFontSize (Font size) can be made in the
- Properties tab. LinearBar consists of 3 areas. These fields are referred to as First, Second, Third Range. It was
 made in order to observe the changes easily.
- From the FirstRangeChange and SecondRangeChange section, we can adjust the intervals.
- It can be set as BarColor (Graph bar color), TemperatureTextColor (Text color), FirstRangeColor (Color of first value range), SecondRangeColor (Color of second value range), ThirdRangeColor (Color of third value range).
- You can find sample usage related to LinearBar in sample scripts in sample 4 in the scripts tab.

CircularBar

Our CircularBar tool is a tool developed to display data in a circle. Visuality and easy view can be used at desired points.

- In the Properties tab, TextColor (IndicatorBrush (Full field color), BackgroundBrush (Background color), TotalValue (Maximum Value) properties can be easily set.
- LinearBar consists of 3 areas. These fields are referred to as First, Second, Third Range. It was made in order to observe the changes easily.
- From the FirstRangeChange and SecondRangeChange section, we can adjust the intervals.
- It can be set as BarColor (Graph bar color), TemperatureTextColor (Text color), FirstRangeColor (Color of first value range), SecondRangeColor (Color of second value range), ThirdRangeColor (Color of third value range).
- You can find example usage of CircukarBar in sample scripts in Example 4 on the Scripts tab.

ACTIVE NOTIFICATIONS

This is the part where active notifications are listed.

	Active Notifications	Notification Settings	Email Settings			0
\bigotimes						
			No	otification Name	Notification Type

Notification Settings

- Notification Name
- Notification Type (SMS or EMAIL)
- Receivers
- Notification Tag (The Part Where the Condition of the Set Tag Value is Determined) •
- Message (Notification Message to Send to User)

consists of sections.

SETTING UP FOR A NEW NOTICE

To set up a new notification;

- 1. A name is given to the notification name. This is the name that identifies the notification we will send to the user.
- 2. Notification Type is selected. This can be selected as either SMS or Email.
- The phone number (for SMS) or Email address (for Email) of the user to whom we will send the notification is entered into the 3. recipients box and added to the list by clicking the "Add" button. Click "Save" if we want to save this recipient and "Delete" if we want to delete this recipient from the list.
- 4. Notification Tagis the part where the condition of the Tag values et is determined. A tag selected from the Tag list on the right is set on the left side of the Notification Tagbox by clicking the "Set Notification Tag" button. One of the symbol values that we want is selected from the middle box for comparison of this set tag value with the value we will write on the right side.
 - These values are; • == (Equal)

 - !=
 - >
 - ° >=
 - < ° <=
 - spahped.
- The message is the part where we write the notification message to be sent to the user. The value of a Tag that we select from 5. the list can be added to the message with the "Enter Tag Value for Message" button in the upper right.

EMAIL SETTINGS

Email Settings is the section where the mail settings used to send E-mail notifications are made.
